

COMPANY PROFILE

Custom Software Services · Public Sector · AI · Healthcare

INTRODUCTION

KENLA Systems is a custom software services company. We design, build, and support internet, mobile, and enterprise applications for clients who need production systems — not a packaged product, and not a disposable prototype. Since 2009 we have delivered that work for government, healthcare, and commercial organizations in the United States, India, and the Middle East.

The brief can be a statewide operations platform, an AI workflow over documents, a patient-facing lab system, or a mobile approval tool. We take ownership of the problem, choose the stack that fits, and stay accountable through launch and after.

We work as an extension of the client team: we learn the business, own the architecture, and ship software other engineers can still maintain years later.

VISION

Creating systems that make connections between people simpler in a complex world.

MISSION

Empower small and medium sized businesses around the world to reach their fullest potential.

FOUNDERS & INVESTORS

KENLA Systems was founded by two software engineers, each with more than twenty years of development experience. The company has since attracted additional investors. Collectively they bring entrepreneurial experience from several successful startups, including Rand Software Corporation, Intelte Engineers, Staytop Systems, and RAN Solutions.

Investors provide sound financial backing and a range of operating experience across software, semiconductors, manufacturing, and general business. That mix keeps the company grounded in both product craft and commercial discipline.

THE COMPANY

Our primary engineering office is in Chennai, India. Engineers and managers at that office cover the following functional areas:

- ▶ Web and mobile application development
- ▶ Generative AI and enterprise application development
- ▶ Cloud, DevOps, and platform engineering
- ▶ Blockchain and Web3 application development
- ▶ Technology research and development
- ▶ New market development

We deliver from India to clients in the United States, the Middle East, and India. Regional presence with global service is part of how we keep cost competitive without giving up accountability.

AREAS OF STRENGTH

These six strengths are how we differentiate ourselves and how we conduct business:

01 Technical knowledge Practiced engineering across web, mobile, AI, cloud, and blockchain — not a single-stack shop.	02 Customer relationships Direct, durable working relationships. We stay close to the problem after the first release.	03 Custom systems, not templates Applications built to the client's process and constraints — not a generic package with a logo swap.
04 Regional presence, global service Chennai engineering with delivery experience for U.S., Indian, and Middle Eastern clients.	05 Delivery quality Testing, review, and operational discipline treated as part of the engagement, not an afterthought.	06 In-house talent training We grow engineers internally so the team that starts a system can still own it years later.

WHAT WE BUILD

We are a services firm. Clients bring the problem; we engineer the system. Work typically falls into these practices, and we staff across them as the engagement requires:

Custom software

End-to-end platforms — from first release to enterprise systems — using modern architectures and code that other engineers can maintain.

Public sector systems

Workshop operations, continuity planning, findings tracking, and other tools used by state departments and the organizations that serve them.

Generative AI & machine learning

RAG pipelines, document intelligence, recruitment and audit assistants, and other LLM-backed workflows.

Healthcare applications

Lab operations, patient-facing tools, and health-data applications for providers, businesses, and individuals.

Cloud, mobile, and platforms

Cloud architecture and operations, iOS and Android applications, and additional platforms when the problem calls for them.

SELECTED CLIENT WORK

Representative engagements, grouped by the work we want to be known for.

Public sector

Legacy Modernization Assistant (LMA)

AI-assisted analysis and generation for decades-old application code

LMA is pointed at legacy application code — COBOL, FORTRAN, DYL-280, and other stacks that have run for decades. It reads that code, then extracts, maps, and analyzes it so the business locked inside the programs is visible before anyone rewrites a line.

From that analysis LMA produces the documents teams need to modernize with confidence: system architecture, business rules and logic, a database catalog, control and data flow, batch jobs, and external integrations. It then designs and generates code for the modernized application from that same analysis, so the successor is based on what the legacy system actually does.

Field Information System (FIS)

Legacy modernization for State of California field operations

FIS replaces a decades-old Informix application that ran on Unix. That system was the operational backbone for field office staff; it could not stay on an aging database and a shrinking pool of people who knew it.

KENLA migrated FIS to a full-stack .NET microservices application on AWS. State staff use it to configure and track budget, expenses, and timesheets for field office staff. The new platform keeps those business processes intact while moving them onto a stack the state can operate and extend.

Independent Project Oversight and Verification and Validation

Developed for Galaxy Solutions, California; used by the State of California

Independent Project Oversight Reporting (IPOR) and Independent Verification and Validation (IV&V) teams needed one place to record findings, observations, and recommendations, and to work with client teams without losing the thread of each item.

IPOR and IV&V are web and mobile applications for tracking those findings through their lifecycle. The team can collaborate across resources to develop findings; client teams can search and retrieve them. Dashboards let executives follow each item from open to close. The system generates reports of various kinds and provides document management for formally submitted report documents.

Business Continuity Management Program

Developed for Galaxy Solutions, California; used by the State of California

State departments needed a way to gauge the quality of their business continuity plans and to produce mandatory reports.

BCMP is a dashboard-driven application. Departments can see the progress of analysis and generate the reports required for mandatory reporting.

Cash for College Workshop Management System

State of California, USA

The California Cash for College (CCFC) workshop series is a partnership of high schools, community colleges, universities, and community groups, funded by the Commission, campuses, Regional Coordinating Organizations (RCOs), and local organizations.

KENLA built the system hosts use to register workshops, request marketing materials and training, conduct exit surveys, and track student performance after the workshop.

Generative AI applications

Insight 360

Values-based AI command center for small and medium-sized businesses

Most SMB teams have access to general-purpose AI, but those tools do not know how the company prefers to operate. Insight 360 is a command center that puts AI behind the business's own values, policies, and working rules so answers and actions stay on-brand.

Operators work from one place: ask questions across company knowledge, draft customer and internal communications, summarize documents, and kick off routine workflows. A values layer sits in front of the models. It encodes what the company will and will not say, how it treats customers, and which decisions need a person. The result is an AI workspace the owner can trust — not a generic chatbot dropped on shared drives.

Annie ACS

AI assistant for a cosmetic surgery clinic

Cosmetic surgery patients ask detailed questions before they book and after they go home: what a procedure involves, how to prepare, and what recovery looks like. Generic medical chatbots guess. Annie ACS is trained on that doctor's procedures, methodologies, and patient-facing guidance.

Annie answers in the clinic's voice from consult through post-operative care. If the source material does not cover the question, it does not invent a protocol; it points the patient back to staff. That keeps answers accurate to the practice and cuts repetitive load on the front desk.

Resume Analysis Assistant

Bulk resume review for HR and recruiting managers

HR and recruiting managers use the assistant to review resumes in bulk against the requirements for a role. Volume is the problem: a posting can attract hundreds of applications in inconsistent formats. The tool is built for that first pass, so the team works from a ranked shortlist instead of a raw inbox.

It surfaces the candidates who best fit those needs and why a profile scored as it did, so managers can compare people and push the strongest set forward. It does not replace the hiring decision. It compresses screening so time is spent on people who actually match.

Healthcare

Saguaro Health

End-to-end laboratory information management system (LIMS) for a diagnostic lab

A diagnostic lab needed one system from sample collection through report generation. Off-the-shelf tools covered slices of that chain and left the rest in spreadsheets and side systems. Saguaro Health was built as a comprehensive custom LIMS so the lab could run the business in one place.

KENLA designed and implemented the system end to end: collection scheduling, sample accessioning and chain of custody, test orders, in-lab status, result capture and review, and formatted report generation. Patients book collections and retrieve reports; lab staff move work through the bench without breaking context; leadership sees what is in flight. It is not a module bolted onto someone else's product. It is the system the lab uses day to day.

TECHNOLOGY STACK

We choose tools that fit the problem. The stack below is what we use in production today, combining current platforms with systems we have supported for years.

Generative AI	LangChain, LangGraph, Hugging Face, AWS Bedrock, ReAct, Chain-of-Thought; Claude, GPT-4, Llama 3, Gemini; vector stores including Chroma and Pinecone
Frontend	React, Next.js, Vue, Angular, TypeScript, HTML5, CSS / Tailwind, Redux
Backend	Node.js, Python, Java, Go, Scala, Express, FastAPI, Spring Boot, Play, Akka, GraphQL, REST
Mobile	iOS (Swift / Objective-C), Android (Kotlin), React Native, Flutter, Cordova, Oracle MAF
Cloud	Amazon AWS, Microsoft Azure, Google Cloud, DigitalOcean, Vercel
Data	PostgreSQL, MySQL, Oracle, MongoDB, Redis, Elasticsearch, Firebase, other NoSQL stores
Blockchain	Solidity, Ethereum, Polygon, Alchemy, Hardhat, Web3.js, IPFS
DevOps	Docker, Kubernetes, Terraform, GitHub Actions, Jenkins, Nginx
Other platforms	Apache Spark, .NET, Ruby on Rails, SAP Mobile Platform
